CUSTOM ENERGY-SAVINGS TIPS

PAST ENERGY USAGE

Soak Up Some Summer Savings

Simple home hacks can help you stay cool—and on budget—all season long. Try a few of these energy-efficient tips to see savings on your next bill.

Weatherproof for the Win

Properly insulate walls, weatherstrip doors and windows, and caulk cracks to help prevent cool air from leaking out and hot air from seeping in.

Make Saving a Breeze

Run a ceiling or box fan to remain comfortable while raising your thermostat up to four degrees. Be sure to turn them off when you leave the room.

Say Goodbye to Stale Air

If things are getting too stuffy, switch on your bathroom fan for an effective way to suck heat and humidity out of your home.

Do Laundry for Less

About 90% of the energy used to wash a load goes toward heating the water, so consider going cold. Then, save even more by hanging washed clothes outside to air dry.

Give Your A/C a Break

Set your thermostat between 76° and 78° when you are home. Each degree you lower the temperature increases your energy usage 6-8%.

Swap Your Air Filter

Cleaning or replacing your HVAC filter regularly can lower your A/C's energy usage by up to 15%. It's one of the most effective things you can do to ensure your system runs efficiently.

Keep the Curtains Shut

Close the blinds on the southern- and western-facing sides of your home to block out the sun's rays and unwanted heat.

Get Grilling

Using the oven and plug-in kitchen appliances generates extra heat inside your home. Unplug any items you aren't using and opt for more outside barbeques instead.
